How to study for programming

Whether you’re currently pursuing a degree in computer science, a veteran using the GI Bill to choose their next mission, an aspiring self-taught developer, or a coding boot camp student, mastering the craft of programming is a perpetual struggle. To assist in your learning – courtesy of the Coding Dojo instructors – here are seven tips on how to code faster. Perhaps by the end you’ll be ready to apply for one of our coding bootcamps. Apply Today 1. Learn how to code faster by doing. With every new subject, the sooner you start playing with the code, the faster you will learn the given concepts. Even if you blaze through an entire chapter of reading and a topic like for loops seems straightforward – so a monkey could do it – you’ll still be scratching your head when tasked to implement the code for the first time. You’ll think, “wait, what was that one piece of syntax again?” As the saying goes, you need to “use it or lose it”, because despite the evolution of technology, this ole’ proverb holds true when learning to code. Hint: Build a project as you go through the material. A personal project is often the best starting point. 2. Learn the programming fundamentals to gain core knowledge As elementary as they may appear at first, programming fundamentals always need to come first: the better you understand them, the easier it is to learn more advanced concepts. From our experience at Coding Dojo, students who rush through the beginning of our courses – where we focus most on web development fundamentals – are often the first to get stuck as we transition into more advanced material, such as back-end programming. So before you ditch the first class of computer science 101, or skip chapter one of an online tutorial, keep in mind that you are overlooking the most important step in your learning. Hint: Read this great article about the 5 Basic Concepts of Any Programming Language 3. Code by hand. It sharpens proficiency and you’ll need it to get a job Computer monitors become thinner, hard drives lighter, and programming languages more powerful, but coding-by-hand still remains one of the most effective methods to learn how to program. Be it on a whiteboard or notebook, coding-by-hand requires further caution, precision, and intent behind every line of code. Because unlike on a computer, you can’t run hand-written code midway through the sheet to check if the work is correct. Although more time consuming, this restriction will mold you into a more fundamentally sound developer, both in the classroom and the job market. For college exams and technical interviews – a critical component of the job interview process – you will have to code-by-hand, because not only is this good for learning, but it’s universally known to be the ultimate test for a programmer’s proficiency. So start early and get used to this old-school practice. 4. Ask for help coding. You’ll need it. As awesome as it would be to become the next Steve Jobs on your own, the reality is that people learn faster with mentors and peer feedback. What may seem like an immovable bug or topic could be quickly alleviated by a fresh pair of eyes or a new interpretation of the subject. Whether it’s online or in-person, ignore the trolls and don’t be afraid to ask for help, because every programmer has been in your shoes before. Besides, most developers love to code, and if there’s one thing that passionate individuals enjoy, it’s to share their knowledge with others. Word of Warning: At Coding Dojo we suggest using the 20 minute rule. Take at least 20 minutes to figure something out on your own before asking for help. There’s a good chance that the answer is already in front of you, and besides, struggling makes you a better programmer overall. Hint: Stackoverlfow and learn programming are gold mines for online programming assistance. 5. Seek out more online resources. There’s a wealth of content If a particular concept doesn’t make sense, be it on in a textbook, or during class lecture, maintain your confidence and look for alternate online resources to learn the same content. Everyone learns differently, and just because one source doesn’t make sense, doesn’t mean there’s something wrong with you. It means that you’re not clicking with the delivery of the material. The online resources to learn computer programming are endless, and there’s always tutorial, or blog explanation that will make the material-at-hand crystal clear. Hint: Don’t underestimate the power of search. 6. Don’t just read the sample code. Tinker with it! Reading sample code is not enough to understand how it works. To develop a true understanding, you need to actually run the code and tinker with it. With the additions of comments and instructions, sample code is packaged to be by the reader; but in reality, it’s pretty difficult to replicate from scratch. Reading is not the same as understanding, and actually trying to write the code yourself, or at least running it, will facilitate the learning process much more. 7. Take breaks when debugging When debugging, it’s easy to go down the rabbit hole for hours, and there’s no guarantee that you will fix the problem. To avoid this, it’s best to step away from the for a few hours, and return with a fresh perspective. Not only is this a guaranteed way to help solve the problem, but you’ll also save yourself hours of headache. So if help isn’t available – to touch on our previous tip about seeking advice – consider taking a break to clear your mind and return later. In the meantime, the bug won’t be going anywhere, and you’ll at least restore some needed sanity to improve productivity. Conclusion: Keep Calm and You’ll Learn to Code Faster Despite these 7 tips, the most important ingredient to learn programming faster is to remain confident. To do so, you should expect to fail repeatedly and be patient with your progress; because becoming an expert at anything requires hard work and time. And if a single doubt ever clouds your mind, remember that every programmer this path before – none of them more destined to become a developer than you. Whichever path you are currently on, be it college or coding boot camp, the only barrier to success is your work ethic and confidence to persevere. Feel like being a developer is something you need to do and wondering “Are coding bootcamps worth it?” Look no further than Coding Dojo. We are the only bootcamp to train you in the 3 stacks used by the world’s best companies in 14 weeks. Just Apply Now (it only takes 2 minutes) — an Admissions Counselor will follow-up to see if Coding Dojo is right for you. No matter how old you are, there’s always room for improvement when it comes to studying. Whether you’re taking the biggest exam of your life or you know your teacher or professor is going to give a pop quiz soon, efficient studying is a great way to be prepared.Create a RoutineOne of the best things you can do for yourself, whether you’re in fifth grade or college, is to make studying a habit. One helpful way to do that is to find a way to incorporate it into your daily routine at the same time every day. Perhaps it’s after dinner or right when you get home from school. Find the time that works for you, and make yourself sit down to study and handle any homework you have at that time every day or on as many days as possible.Break It UpEveryone’s been there. You wait until the very last minute to study, and you do it all in one sitting. Not only is it exhausting, but you probably also don’t even remember half of what you study. This is why it can be better to break it up and do a little bit each day. If you have a big project coming up in a few weeks, break it down into steps, and take on one of the steps every other day until everything is complete. If you have plenty of reading to do, break it down into chapters or pages, and read one section each day.Get Some SleepWhile it can be tempting to stay up all night studying before a big exam, you’re better off getting sleep. Your brain and memory function better when you’re rested, so you can retain more of the information and do better on your test. If you didn’t get a full night of sleep, consider napping briefly during the day to help catch yourself up on sleep.Clear Your MindBefore you sit down to study, make sure you have a clear mind and that you’re not focused on something else. Take a walk, listen to some music, read a book or do some stretches. Try meditation. Do whatever it takes to get your mind in the right mood for study time. Be sure to take breaks while you study too. Resting for five minutes every 30 to 60 minutes may help you retain the information.Create the Right EnvironmentFinally, create a good study environment. It can be hard to pay attention when the TV is on or when you’re constantly receiving texts from friends. Turn off your devices. If you don’t do well with quiet, use a fan for background noise, or turn on a radio. You may find it more effective to study to music that doesn’t have lyrics. Make sure you’re comfortable and organized. You’ll also want to make sure you have plenty of water and a few healthy snacks on hand if you’ll be studying for a while. MORE FROM QUESTIONSANSWERED.NET
